**MACHINE VISION AND ANALYSIS FOR
OPTICAL MICROMANIPULATION**

Ryan Smith, John Van Fleet, Eric Macaulay and Gabriel C. Spalding*
Department of Physics, Illinois Wesleyan University

We are engaged in two distinct studies of optical micromanipulation, both of which require the development of machine vision algorithms. Our first study aims to characterize the extent of microparticle localization (*i.e.*, the trap volume) in a single-beam optical gradient trap (“optical tweezers”) via analysis of the distribution of particle positions over time, using the statistics of (three-dimensional) Brownian motion as a metric of the trapping potential. We hope to compare “isoprobability surfaces” for different laser wavelengths. Our second study involves multiple particle species that are *not* trapped, but are entrained within a microfluidic flow passing through a three-dimensional optical lattice. We hope to build up detailed statistics of particle channeling within the lattice, and the details of dense-flow interactions.
