Randazzo, Krystal and Nillas, Faculty Advisor, Leah, "Engaging HS Geometry Students Through Student-Centered Activities" (2015). *John Wesley Powell Student Research Conference*. 11.  
<http://digitalcommons.iwu.edu/jwprc/2015/ESposters/11>

This Event is brought to you for free and open access by The Ames Library, the Andrew W. Mellon Center for Curricular and Faculty Development, the Office of the Provost and the Office of the President. It has been accepted for inclusion in Digital Commons @ IWU by the faculty at Illinois Wesleyan University. For more information, please contact [digitalcommons@iwu.edu](mailto:digitalcommons@iwu.edu).

# Engaging HS Geometry Students Through Student-Centered Activities

Krystal Randazzo and Leah Nillas\*

*Educational Studies, Illinois Wesleyan University*

## Research Question

How does hands-on exploration with physical and virtual manipulatives impact students' engagement in geometry?

**Manipulatives** are defined as concrete materials that students utilize in order to better comprehend abstract concepts (McNeil & Jarvin, 2007).

**Engagement** involves three key components: behavioral, emotional, and cognitive (Fredericks, Blumenfeld, & Paris, 2004).

## Literature Review

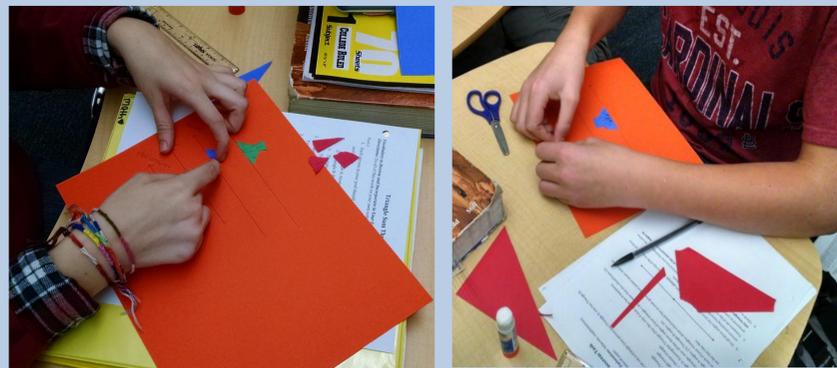

- McNeil and Jarvin (2007) stress that manipulatives should be used as mathematical tools rather than toys.
- Steen, Brooks, and Lyon (2006) illustrated that students' retention of mathematical concepts can be improved through the careful implementation of both concrete and virtual manipulatives.
- Manipulatives on their own can act as a perceptually rich tool in order to develop students' conceptual understanding (Bhatia, Premadas, & Martin, 2014; Reimer & Moyer, 2005).
- According to Erkoc, Gecu, and Erkoc (2013), both concrete and virtual manipulatives were effective in improving students' spatial reasoning over time.
- Gaps in the research exist in how hands-on activities specifically impact cognitive, behavioral, and emotional engagement.

## Methodology

- Participants included 30 high school students in 2 geometry classes in a small, rural public school.
- 23 hands-on activities were implemented throughout the semester.
- Data was collected from lesson plans, student work samples, student questionnaires, and teacher reflections.
- Data sources were content analyzed in order to identify themes related to mathematical proficiency and engagement.
- A conceptual framework was created in this research study.

## Results and Data Analysis

- Analysis of lesson plans resulted in emerging themes of developing students' conceptual understanding and adaptive reasoning and students' engagement in investigative and exploratory learning.
  - Figure 1 and Figure 2 represent examples of exploratory hands-on activities.
- Thoughtfulness, effort, participation, and positive reactions were emergent themes in student work samples and student responses.
  - 89% of the students claimed to be either somewhat or very much engaged in activities involving physical manipulatives.
- Analyses of lesson plans, student work, and teacher reflections provided evidences that exploratory activities prompted deeper discussion and novel hands-on activities promoted greater student participation and positive reactions.
- Issues with functionality in manipulatives like problems operating compasses and confusions with performing tasks in geometer's sketchpad led to less student engagement.

**Figure 1.** Students prove the triangle sum theorem by creating a line with the three interior angles of the triangle.

**Figure 2.** Students explore the basic properties of a circle using a compass .

## Conclusion

- Findings support Puchner, Taylor, O'Donnel, and Fick's (2008) suggestion to utilize hands-on activities for exploration as it leads to increased cognitive engagement.
- Novel activities positively impact students' behavioral and emotional engagement.
- Further research in additional high school mathematics classes is needed to supplement findings in this research study.
