**A POSSIBLE NEW AMINO ACID DETECTION AGENT:  
6H-2,4-DIHYDROXYINDENO[2,1-g]PTERIDIN-6-ONE**  
Niki M. Handlin & Forrest J. Frank\*, Illinois Wesleyan University  
P.O. Box 2900, Bloomington, Illinois 61702

Ninhydrin (1,2,3-triketohydrindene hydrate) (2) is the most commonly used amino acid detection agent. When ninhydrin reacts with amino acids it results in a purple coloration, but no fluorescence. The focus of this study is to synthesize a pteridine analog of ninhydrin which reacts with amino acids to form fluorescent products. The compound 6H-2,4-Dihydroxyindeno[2,1-g]pteridin-6-one (1) an analog of ninhydrin (2) is being synthesized via the reaction between ninhydrin and 2,4-dihydroxy-5,6-diaminopyrimidine sulfate (3). The Timmis synthesis between 1,3-indandione and 6-amino-2,4-dihydroxy-5-nitrosopyrimidine results in the same compound (1).
