PRIME DESERT $n$-TUPLETS OF LENGTH $k$

Derek M. Marusarz, Dept. of Mathematics, IWU, George Polites *

The necessary condition for prime desert $n$-tuples of length $k$ has been found but it is still not known what will guarantee their existence. To this end, a construction process has been devised to search for them and various theorems have been looked at to find a theoretical solution to the problem. This talk will treat basic definitions and examples in this research, show what has been done with the theoretical aspects and will treat the efficiency of the construction process.
