An Example of Autonomous Art in Simple Deterministic Processes  
Exotic Pattern Formation in Swelling Gels

Dana Deardorff, Kimberly Branshaw and Narendra K. Jaggi \*  
Physics Department, Illinois Wesleyan University

Last year, we discovered a rare and elegant coarsening mode in some gels that leads to intermediate structures that are complex and beautiful. They were discovered accidentally when a relatively large and thick cylindrical piece of the high density, crosslinked polymer was allowed to swell in water over an extended period. We have now developed an understanding of the underlying physics. Consequently, we are able to 'guide' a range of 'self organizing sculptures' whose aesthetic quality approaches art. Individual 'works' vary sufficiently so that the showing of a series of slides successfully elicits oohs and ahs from an audience. Yet, the series has unambiguous stylistic signatures that enable the identification of unique authorship, viz.. itself. This is by no means fundamentally novel. Every hiker and biker knows that natural processes can lead to beautiful structures. The joy in our work is of a slightly different variety. Our knowledge that these delicate, ornate sculptures with the majestic curves befitting Arabic calligraphy are swelling pieces of jello, gives us a sense of joy that is not quantifiable. We can guide the process just a bit so that successive patterns are sufficiently different to be interesting. But we can not predict the exact pattern that will emerge. This allows us to conduct a flirtatious dialogue with the work that is, for lack of a better word, fun.
