PREDICTORS OF RELAPSE AND LONG-TERM RECOVERY IN PANIC DISORDER

Leann Westerhold, Department of Psychology, IWU and Timothy J. Bruce, Ph.D., * Dept. of Psychiatry, UICOMP

Previous studies of panic disorder have examined predictors of relapse in the short-term. This study investigated predictors of relapse and long-term recovery in panic disorder treated with alprazolam or alprazolam plus cognitive behavior therapy (CBT). Relapse was defined as a return to medication or other panic disorder treatment after discontinuation. Logistic regression analysis was used to determine if any predictors of relapse versus long-term recovery were evident. The results and implications for future treatment will be discussed at the 6th Annual IWU Student Research Conference.
