Poster Presentation P41

**EFFECT OF PACLOBUTRAZOL, A GIBBERELLIN BIOSYNTHESIS  
INHIBITOR, ON DARK-GROWN PROTONEMA OF  
*CERATODON PURPUREUS*.**

Katie Polak and Loni Walker \*

Department of Biology, Illinois Wesleyan University

Plants utilize chemical messages called plant hormones to regulate growth and development. One of these plant hormones, gibberellin, mediates a number of developmental processes in flowering plants, including seed germination, flowering, and stem elongation. While there is a wealth of information about GAs in flowering plants, there are only a few references in the literature concerning GA's in mosses, a non-flowering plant.

Preliminary research by former IWU student (Justin Paprick) suggested that the exogenous application of a GA biosynthesis inhibitor resulted in a decreased growth response in the moss *Ceratodon purpureus*. This decrease in growth suggests that endogenous gibberellins are important for growth in *C. purpureus*. To further investigate the role of gibberellins in *C. purpureus*, a GA biosynthesis inhibitor was applied to dark-grown protonema (a juvenile form in moss) and the growth response was analyzed. The results of this analysis will be presented.
