Asian Americans are usually referred to as the “model minority” due to perceptions of their high income and educational attainment; yet relatively little is known about their economic assimilation experience. The purpose of this study is to determine economic assimilation of Chinese immigrants over time. This research follows a cohort of Chinese immigrants from 1994 to 2011 and compares their earnings performance with natives that have similar educational attainment. Multiple regression analysis is used to analyze data from the Current Population Survey. Results show that, although the cohort of Chinese immigrants initially has earnings substantially lower than the natives, it is only about 10 years before they reach income parity. By 2011 Chinese immigrants’ earnings exceed natives’ by about 4 percent. The study concludes that despite the language and adjustment challenges, Chinese immigrants do show relatively rapid economic assimilation in the United States.
