Poster Presentation P45

A MULTI-CHANNEL, MULTI-MODE BIOPOTENTIAL MEASUREMENT DEVICE

Boxiang Liu and Thushara Perera*
Physics Department, Illinois Wesleyan University

We present research related to the design and construction of a biopotential measurement device that can be utilized for Electroencephalograph (EEG), electrocardiograph (ECG), electromyograph (EMG), and electrooculograph (EOG) measurements. Novel aspects of this device include JFET-based active electrodes, the stringent use of shielding and balancing methods, as well as other low-noise techniques and components. The circuit includes a pre-amplifying stage, an active low pass filter, an active high pass filter, and a final amplifying stage. An integrator is included for the EMG measurement. A switch enables the user to pick between modes of measurement. Our goal for the immediate future is to combine multi-channel signals to control a game named Osmos, which requires directional signal and speed signal inputs.
