## Decomposing complete graphs into a graph pair of order 6

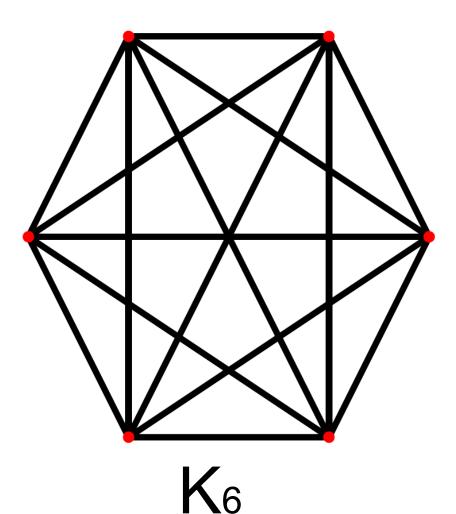

### **Purpose:**

Decomposing Kn into a partiular graph pair of order 6.

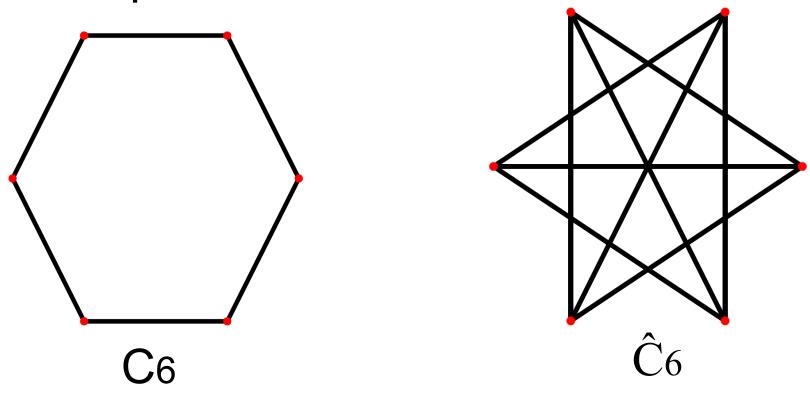

Definition:

Graph: A graph G is a triple consisting of a vertex set V(G), an <u>edge</u> set E(G), and a relation that associates with each edge two vertices called its end points.

A <u>complete graph</u> is a graph in which each pair of graph vertices is connected by an edge.

The <u>complement</u> of a graph G is the graph with the same vertex set by whose edge set consists of the edges not present in G.

A <u>decomposition</u> of a graph is a list of subgraphs such that each edge appears in exactly one subgraph in the list.

A graph pair of order n is a pair of connected graphs on n vertices with no isolated vertex whose union is Kn. In this case, we will use C6 and its complement to decompose Kn

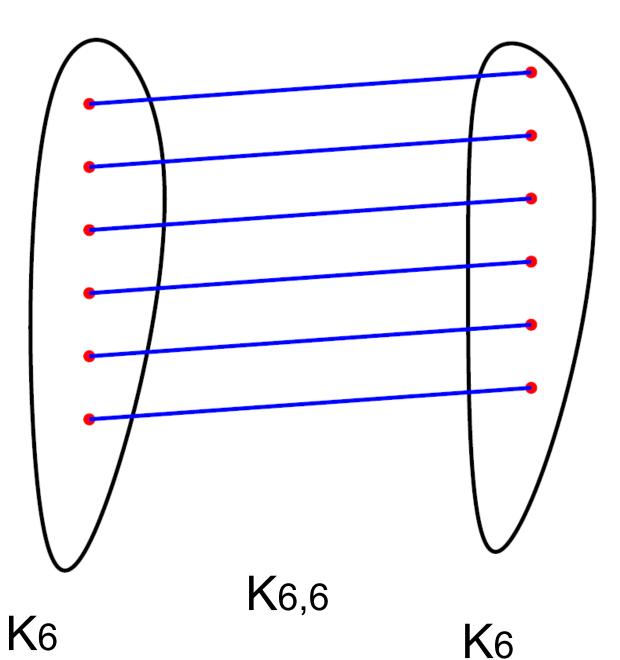

Yizhe Gao Illinois Wesleyan University Instructor: Daniel Roberts

## A Proof

By simple algebra, necessary conditions for a multidecomposition of Kn into C6 and Ĉ6 are n=0,1,3,4 mod 6. Then, we want to show that these conditions are sufficient by constructing a multidecomposition in each case.

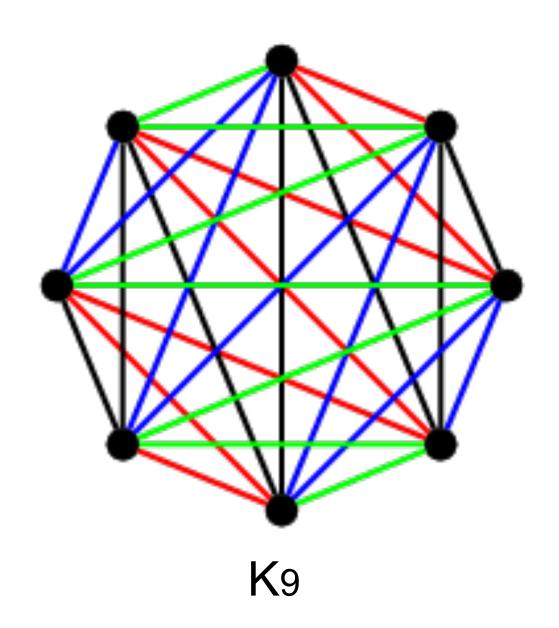

1)Show that Kn can be decomposed into C6 and its complement if  $n = 0 \mod 6$ .

In this case, Kn can be seen as the union of many K6 s connected with K6,6 s. K6 s can be decomposed into C<sub>6</sub> s and their complements (one copy in each). We need to show that K6,6 s can also be decomposed into C6 s or its complement. By Sotteau's theorem, K6,6 can be decomposed into C6 s. Hence, since Kn can be decomposed into C6 and its complement when  $n=0 \mod 6$ , the decomposition exists when n= 0 mod 6.

2) Show that Kn can be decomposed into C6 and its complement when  $n=3 \mod 6$ .

First, we can take a look at some small examples of Kn when n= 3 mod 6. For example, are we able to show that K9 can be decomposed into graph pair of order 6?

By edge condition, since K<sub>9</sub> must have at least one complement, there are 36-9=27 edges left. After doing some simple algebra, I find that the decomposition can only exist if there are 3 more C6 s and one Ĉ6 in K9.

Then, we need to see whether the decomposition above exists given the degree condition. Each vertex of K<sub>9</sub> must have degree of 8. Since we have already removed one C6 complement, 6 vertices have degree of 5 left. However, since a C6 removes 2 degrees from each vertex and 5/2 is not an integer, it is not true that K9 can be decomposed into graph pair of order 6 since some vertices only have degree of 5 left.

## **CURRENT RESULT**

Kn can be decomposed in to graph pair consisting of C<sub>6</sub> s and their complements if n is 0 mod 6. Also, K9 can not be decomposed in that way.

# FUTURE STUDY:

I will try to test the sufficient conditions for the decomposition of  $K_n$  if n=1,3 and 4 mod 6.
